Replay Xcessory Quick Start

Read this document to get started quickly with Replay Xcessory. It tells you about the following topics:

- What is Replay Xcessory?
- Starting up Replay Xcessory
- Understanding the Replay Xcessory Test Manager window
- Recording
- Playback
- Examining results
- Troubleshooting
- Additional features
- Using Replay alone

What is Replay Xcessory?

Replay Xcessory allows you to test your X Windows application using widgetbased testing.

Once you have loaded your application in Replay Xcessory, you can perform tests by manipulating and storing the behavior and state of each and every widget for a particular sequence of user actions. You can "record" these user actions in *test scripts*, which capture user behavior as it affects the widgets. You can then "replay" the test script to replay the behavior: the clicks, drags, and moves that were done to each widget.

In other words, you do not have to manually repeat the same set of actions to repeat a test; you can just run the script again. You can also write scripts that cause user actions to be simulated.

After you record a baseline snapshot of the correct results for a particular behavior, you can replay the test script and generate a report that compares the outcome to the baseline results.

You can use *snapshots to* compare test results. Snapshots provide a picture of the screen that results from user actions. Replay Xcessory snapshots save your application at the widget level; that is, they describe the X resources and their values. This kind of "logical" snapshot is usually more portable and easier to maintain than literal bitmap images, which are also an option with Replay Xcessory.

Starting up Replay Xcessory

To install Replay Xcessory, follow the directions provided in the *Installing and Managing ICS Products* manual. If you wish to use Replay without the Test Manager, see the appendix of this document for further instructions on setting up Replay Xcessory.

For this example, you can launch the Replay Xcessory from the Replay Xcessory Test Manager, which you start by invoking the following command:

\$ replaytm

The best way to use Replay's commands is to put **path_where_Replay_installed/bin** directory on your path.

\$REPLAYHOME/bin

Understanding the Replay Xcessory Test Manager Window

The Replay Xcessory Test Manager opens to a user defined testsuite. The default test suite, included with the installation, appears as shown:

File View Test	Test Mar - /opt/reglay/examples/testsuite IPáckase	Help
padi <u>colors</u> paci_tester pack_tests pack_rmcalc	demonstrates getting values of various properties of motif widgets demonstrates context-sensitive positions for list and text widgets simple test program - noninteractive test preview programmed script using an external input data file	
2		

There is no limit on the number of test suites a user can create. Each line in the test suite represents a *test package*. Each test package may contain any number of *test cases*. Test cases consist of the files and directories associated with a recording session.

Using Replay Xcessory Help

Replay Xcessory provides context sensitive help to assist you in using the product. To get information on any window, select **Help** from the **Help** menu for a window. or select the **Help** button. A Help window appears describing how to use that window.

Setting up a Test Package

To illustrate the use of Replay Xcessory, we'll record and replay a test of the **xmcalc** program in the **testsuite** directory.

To create a test package for this example, select **New Test Package...** in the **Test Package** menu.

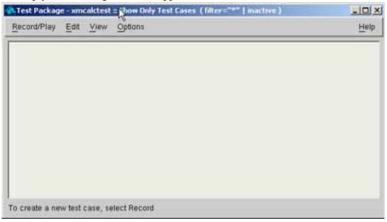

The Test Package dialog box appears:

X Test Package		<u>1</u>			×
Test Package Name	mealther				
Title.	1				_
Description	T				F
					- 11
	14				-
0	c 11	Cancel	ar e	Help	- 6
-		 2 21 21 1		1001	

For this example enter the following information:

- Step 1 In the Test Package Name area, enter a name, such as xmcalctest, as the name of the directory for the new test package.
- Step 2 In the Title area, enter a single-line description. This will appear as one of the lines in a directory listing
- Step 3 In the Description area, describe the test package in as much detail as necessary. This information, along with the Title information, appears in a *testpackagename*.tpd file in the new test package directory.
- Step 4 Select OK to complete test package creation.

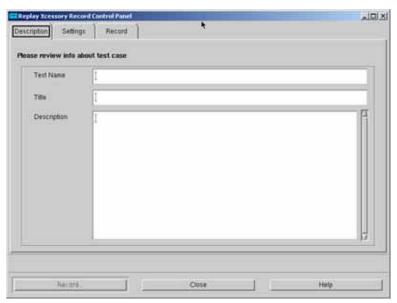

An empty Test Package window appears:

Recording

To start a recording session for the **xmcalctest** test package, select **Record** ... from the **Record/Play** menu in the **Test Package** window.

A Record Control Panel Description page appears, as shown:

In this recording session, you create a script file and baseline snapshots for test case verification.

Setting up the Recording Session

Here are the steps to record a script containing two calculations using the **xmcalc** program:

NOTE	In this section, only the requirements for recording a script will be discussed. There are other options in these menus that can be set. For more information on these settings, see the <i>Replay Xcessory User's Guide</i> .
Step 1	In the Test Name area, write the name of the test. This is required. In

- Step 1 In the Test Name area, write the name of the test. This is required. In the Title area, write the title of the test, such as testcase. This can be omitted if desired. You may fill out the Description area with a description of the test if you wish, although this is not required.
- Step 2 Click to the Settings page, as shown:

Application Under Test:	11000000	
Start Application []	App App	args []
Connect to Running Appli		NE-1*
Display Options		
 Always use \$DISPLAY vi 	due	
Use this X Display	Jocethod 11.0	
Test Files		
Record Script	bestcase.tcl	🛃 🔟 Append
Baseline Snapshot (Dir):	best: aso bet	I
Results Snapshot (Dir)	Bestcase res	I
Report File:	Bestcase opt	1
_i Override Test Package Settings	(dimper)	

- Step 3 In the Application Under Test area, place the cursor in the Start Application box and type the path to the AUT (xmcalc). Alternatively, you can select the arrow to the right of the test field to browse to the AUT. There are only executable files available for you to choose.
- **Step 4** The **Display Options** area is set to the location of the display being used. The default is "Always use \$DISPLAY value".
- Step 5 The Record Script area (.tcl extension), the Baseline Snapshot (Dir) area (.bsl extension), the Results Snapshot (Dir) area (.res extension), and the Report File area (.rpt extension) are by default the test case name you specified on the Description page. You may change these names if you like, although it is often easier to organize the files if all files relating to the same test case have the same name.

NOTE The snapshots taken during this recording session will be placed in the directory specified in the Baseline Snapshot area and used as the baseline snapshots for the subsequent play session.

Step 6 Press Record to begin recording the script.

Two things occur: the main window of the calculator appears, and the buttons along the bottom of the record control panel change to a new set of buttons that allow you to control the record session itself. For example, there are buttons to mark the beginning of a test case, take a snapshot, pause, and so on. Here's an illustration of the Record Control Panel as it appears while you are recording:

1 Car	ord Button Up Motion	 Use Virtual Key Names Minimize Names 	Active Pause Warp Cursor on Snap	
	press Motion bod Sensitive Lists	 Minimize Names Use Tag Names 	Scope Object	shot 🝸
current click	MC alculator) (/AC) (/1) (A) (B) (A)) true Snapshot) true		2

Recording the Script

To record a test script, follow these steps:

Step 1 In the calculator application, multiply 14 times 15 times 16 by selecting the following buttons: AC, 14, *, 15, *, 16, =.

As the calculator keys are pressed, the generated script appears in the scrollable area in the Record Control Panel.

Step 2 In the Record Control Panel, select the **Snapshot** button to save the results of this calculation as a snapshot.

Notice that the **Snapshot Scope** field defaults to **Object**, which means that widget values will be saved. See the *Replay Xcessory User's Guide* for more information about snapshot scopes.

The cursor changes to resemble a camera.

Step 3 Move the cursor over the LCD area of the calculator; this area displays the results of a calculation. With the top left corner of the cursor is over the area, click.

Replay Xcessory takes a snapshot of the LCD widget only (while the snapshot scope is set to object).

- Step 4 Divide 7 by 2 by selecting the following buttons on the calculator: AC, 7, /, 2, =.
- Step 5 Again, select Snapshot and click the camera cursor over the LCD area of the calculator. Note that it is the top left edge and not the cen-

ter of the camera cursor that is being snapped.

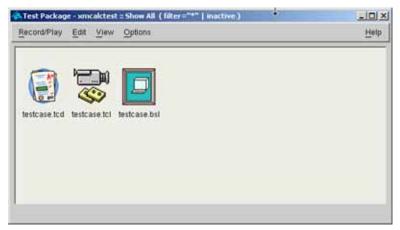

- **Step 6** Exit from the calculator by choosing **Close** from the window manager menu, or click the right mouse button on **AC**.
- Step 7Select the Stop Record button, at the bottom of the Record Control
Panel to end the record session.
- **Step 8** Select the **Close** button to dismiss the Record Control Panel.

Viewing the Test Package

The Test Package window now appears as shown:

Test Package - xmcalctest :: Show Only Test Cares (filter = "**" inactive)				
Record/Play	Edit	View	Options	Help
testcase tod				
1				

There is only one icon in the **Test Package Window**, which represents the **Test Case** "testcase" that was just created. To show all the files in the current test package, click on the empty space below the existing icon and select **Show All** in the popup menu. The current window changes to the next view:

In the recording session, you created a script file and baseline snapshots for test case verification. You now have everything that is necessary for a play session.

Playback

To begin a play session, click on the test case icon and select **Play...** from the **Record/Play** menu in the **Test Package** window, or just double-click on the test case icon.

The Play Control Panel opens as shown:

Settings Playback	ward	
Play Test Case: testcase	Details	
Application Under Test	ed in Tast Cosint	
Use Text Package delau		
 Connect to running app 		
	verrides aplication specified in test script)	
Foptirenisy/premples/min/		
_ Use these command line		
	- 14	_
Alwayi use \$DISPLAY	value	
✓ Use this X Display:	Jocethosh11.0	
	Torreaunite Linn	
and the low party of th	- 1	
ACCOUNT (ACTION)		1.2
Play Script]Jestcase.tcl	1
-COO(14) (-CARD)] testcase.tcl	_1
Play Script	Jestcase tcl []]estcase bsl	4
Play Script Script Arguments:]]]estcase.bsl	
Script Arguments Baseline Snapshot (Dir) Results Snapshot (Dir)	I Jestcase.bsl Jestcase.res	4
Play Script Script Arguments Baseline Snapshot (Dir)]]]estcase.bsl	
Play Script Script Arguments Baseline Snapshot (Dir) Results Snapshot (Dir)	I Jestcase.bsl Jestcase.res Jestcase.rpt	4

Replay Xcessory knows which application to run on playback from the recorded tcl script, but you can change the program by selecting the **Start this application** option and specifying the desired application. By default the **Baseline Snapshot (Dir)** area is set to **testcase.bsl**, the directory used in the record session, the **Play Script**: area has the script name, **testcase.tcl**, the **Results Snapshot (Dir)** area is set to **testcase.res**, and the **Report File** is set to **restcase.rpt**.

To replay the script, follow these steps:

Step 1 Select the **Play** button to start the script and generate results.

As the script begins, the play control panel expands to show a script view area just below the speed selector. As the script is replayed, the script commands appear in the script view area and the state of the application GUI changes. For instance, the cursor moves over the calculator buttons being pressed.

The play speed will seem slow if there were pauses while recording. To rerun the play session at a faster rate, adjust the play speed scale on the play control panel. Drag the slider to the right towards 1.0 before pressing the **Play** button.

When the script is finished, exit from the Play Control Panel by selecting **Stop** and then **Close**.

Examining the Results

After you complete the example record and playback of the **xmcalc** test package, the **Test Package** window appears as follows:

Viewing a Test Report

The report icon is named with the **.rpt** suffix. Since you provided baseline snapshots and requested a report file, the report file should indicate—based on snapshot comparisons and other possible conditions specified by the test case creator—whether the tests were successful.

To look at the test report, double click on the report icon in the **Test Package** window, or select the icon and then select **View Object** from the **View** menu.

A view pane opens from the bottom of the Test Package window, displaying information similar to the following:

Test Package - xmcalctest :: Show All (filter="4" mactive.)	
Record/Play Edit View Options	Help
iestcase.tod iestcase.tol iestcase.tol iestcase.res iestcase.rpt	
Report: testcase/testcase.rpt Replay Xcessory Test Report

Generated on Mon Sep 26 18 18 33 2005 INPUTS Test Package: /opt/replay/examples/lestsuite/vmcalctest Script: testcase.tcl Baseline: testcase.tsl	A
Replay Xcessory Test Report Generated on Mon Sep 26 18 18 33 2005 INPUTS Test Package: /opt/replay/examples/festsuite/vmcalctest Script: testcase.tcl	

Identifying Test Results

To find out whether your tests succeeded, scroll through the **.rpt** file until you view the "OUTPUT LOG" section, which shows you the outcome of comparisons between the snapshots and the baseline. The comparisons are in the form of **diff** statements for logical snapshots and **xwddiff** statements for image snapshots. If there are no differences the output is labeled "Passed".

Here's an illustration of the output log for the testcase.tcl script:

```
OUTPUT LOG
-------
18:18:47 diff testcase.res/vr0001.20050926181531.snp testcase.bsl//vr0001.20050926181531.snp Passed
18:18:55 diff testcase.res/vr0002.20050926181641.snp testcase.bsl//vr0002.20050926181641.snp Passed
```

The report also has a summary, which shows percentages of tests with various outcomes. The possible outcomes are "Passed" and "Failed".

Exiting

You can close the **Test Package** window by selecting **Close** from the **Record**/ **Play** menu.

Then you can exit the Replay Xcessory Test Manager by selecting **Exit** from the **Test Package** menu in the **Test Manager** window.

Troubleshooting

This section describes some common problems and their solutions.

Symptom	Suggested Action
Nothing is recorded when you run the xmcalc example	Make sure that the version of xmcalc being executed is the one in the \$REPLAYHOME/examples/bin directory. You can use the which command to find out which xmcalc you are running or check whether the program that you are trying to run is linked against the shared libXt or against the customized static libXt, which can be found in REPLAYHOME/lib/Xt .
Nothing is recorded when you run your application	Confirm that setuid programs are statically linked with the Replay Xcessory Xt library. They must be statically linked with Replay because these programs typically ignore the library path environment variable.
	Programs spawned by the setuid program must also be statically-linked with the Replay Xcessory Xt library as they do not inherit the library path.
	If you need to test an application started by a shell script, ensure that your script follows the following format:
	old_sp=\$LD_LIBRARY_PATH LD_LIBRARY_PATH=\$old_sp:' <i>any_additional_libs</i> ' export LD_LIBRARY_PATH Replay's Xt lib will be contained in 'old_sp' and is needed for recording tests.

Additional Features

This *Quick Start* shows you how to get started using the Replay Xcessory Test Manager for widget-based testing. In addition you can use Replay Xcessory to perform the following advanced tasks:

- Debug test scripts
- Control the scope and granularity of Replay Xcessory snapshots
- Run test scripts you have written using Tcl (a tool command language)
- Run test suites in batch mode, using Replay Xcessory's command language
- Use virtual and pseudo X servers for background testing
- Use source debuggers to debug your application during play sessions
- Record and play back applications that use custom widgets
- Extend Replay Xcessory's command language to include custom Tcl commands
- Operate on objects, not on screen location
- Copy and link test cases

See the Replay Xcessory User's Guide for more information about these topics.

For Further Help

See the *Installing and Managing ICS Products* manual for information about installing Replay Xcessory.

See the Replay Xcessory User's Guide for more details about Replay Xcessory.

Use the UNIX **man** command to view manual pages for the **replay** and other shell commands and the Tcl commands.

Appendix: Using Replay Alone

This section is a quick guide to using the Replay driver alone instead of using with the Replay Test Manager, replaytm. A user who prefers to use replaytm may skip this section of the *Replay Xcessory Quick Start* guide.

Using Replay Xcessory with Your Application

To use Replay Xcessory you must make sure that your application uses a Replay Xcessory version of the Xt libraries, in case it is linked statically, instead of the regular version.

Starting up Replay Xcessory with the Replay Driver

You can use Replay Xcessory as a standalone product by typing the following command:

replay -r -tcd testcase

Using the **-r** option starts a recording session. Omitting the option starts a play session.
